

Goodbye New Pond Problems

The chlorine present in raw tap water is toxic to fish and the biological balance of the pond. Goodbye New Pond Problems removes the chlorine and matures biological filters so that a safe pond environment is achieved.

Always use in new ponds, when adding tap water, when introducing new fish, after filter maintenance, and at any time when the biological balance has been disrupted. Re-sealable foil pouches containing 2 x sachets.

Each 25g sachet dechlorinates ponds up to 1000 gallons/ 4500 litres. Treat once a week for two weeks in new ponds and whenever needed thereafter.
